

Controls & Automation

The Wasmer Company understands that knowledge is power; and that the greatest source of knowledge in your facility is in the form of performance metrics. By power monitoring your facility and combining those metrics with your production data, a complete picture can be created of how, when, and what is consuming your energy; giving you the power to control that consumption.

Capabilities:

Implement Facility-wide Power Monitoring Systems

Assist in determining attainable goals and the key performance indicators for those goals.

Custom dashboard and alarms based on metrics collected

And much more!

You Can't Manage What You Don't Measure

Who doesn't like having control over a situation? But there are so many unknowns! The "unknowns" are opportunities for you to take better control of your operation and your facility. The Wasmer Company helps identify the unknowns, putting the power back in your hands when trying to control your energy consumption.

Step one: Discuss what you want to control. Step two: Decide how you are going to measure it. The metrics you collect will assist in taking control of your operation by helping you create reduction goals; separating costs between business units; keeping track of improvements made to consumption; allowing you to double check equipment consumption versus utility bills; and the list goes on. The possibilities are endless, and sometimes highly creative! And those creative, "aha" moment solutions are what The Wasmer Company thrives on.
